

# Java 15 PROGRAM (ASSIGNMENT) ➡

## 10 Simple Java Programs (Using Only Operators & Conditions)

### 1. Add Two Numbers

👉 Covers: Arithmetic operator +

```
class AddTwoNumbers {  
    public static void main(String[] args) {  
        int a = 10, b = 20;  
        int sum = a + b;  
        System.out.println("Sum = " + sum);  
    }  
}
```

### 2. Subtract Two Numbers

```
class SubtractNumbers {  
    public static void main(String[] args) {  
        int a = 50, b = 15;  
        int diff = a - b;  
        System.out.println("Difference = " + diff);  
    }  
}
```

### 3. Multiply and Divide Two Numbers

(H.W.)

### 4. Check Even or Odd

```
class EvenOdd {  
    public static void main(String[] args) {  
        int num = 9;  
        if (num % 2 == 0)  
            System.out.println("Even Number");  
        else  
            System.out.println("Odd Number");  
    }  
}
```

### 5. Check Positive, Negative or Zero

```
class CheckNumber {  
    public static void main(String[] args) {  
        int num = -7;  
        if (num > 0)  
            System.out.println("Positive");  
        else if (num < 0)  
            System.out.println("Negative");  
        else  
            System.out.println("Zero");  
    }  
}
```

## 6. Find Greater of Two Numbers

```
class GreaterOfTwo {  
    public static void main(String[] args) {  
        int a = 25, b = 40;  
        if (a > b)  
            System.out.println(a + " is greater");  
        else  
            System.out.println(b + " is greater");  
    }  
}
```

## 7. Find Greatest of Three Numbers

```
class GreatestOfThree {  
    public static void main(String[] args) {  
        int a = 15, b = 25, c = 10;  
        if (a > b && a > c)  
            System.out.println(a + " is greatest");  
        else if (b > c)  
            System.out.println(b + " is greatest");  
        else  
            System.out.println(c + " is greatest");  
    }  
}
```

## 8. Check if Number is Divisible by 5 and 11

```

class DivisibleCheck {
    public static void main(String[] args) {
        int num = 55;
        if (num % 5 == 0 && num % 11 == 0)
            System.out.println("Divisible by both 5 and 11");
        else
            System.out.println("Not divisible by both");
    }
}

```

## 9. Find Maximum Using Ternary Operator

(Ternary operator ek short cut hota hai if-else likhne ka.

Yani — ek hi line me condition check karke decide kar sakte ho ki kya karna hai.)

⚙️ **Formula (Syntax):**

**(condition) ? value\_agar\_true : value\_agar\_false;**

👉 Agar condition true hai to pehla value lo,

👉 agar false hai to doosra value lo.

```

class MaxTernary {
    public static void main(String[] args) {
        int a = 18, b = 12;
        int max = (a > b) ? a : b;
        System.out.println("Maximum = " + max);
    }
}

```

## 10. Find Greatest of Three Numbers

👉 Nested ternary: Pehle a aur b compare karega, fir usme se jo bada hai uska comparison c se karega.

```
class GreatestThree {  
    public static void main(String[] args) {  
        int a = 12, b = 25, c = 20;  
        int max = (a > b) ? ((a > c) ? a : c) : ((b > c) ? b : c);  
        System.out.println("Greatest = " + max);  
    }  
}
```

## Java Programming Questions

- 1 WAP (Write a Program) to find the largest number among three numbers.
- 2 WAP to find the largest number among four numbers.
- 3 WAP to find the largest number among five numbers.
- 4 WAP to find the largest number among six numbers.
- 5 WAP to find the largest number among seven numbers.
